OneShot Diesel Additives

... Protection and Performance For Every Season

100ml
Treats
400 L

OneShot Diesel Storage Pro

- ✓ Inhibits deposits & varnish
- ✓ Disperses sludge / deposits
- ✓ Improves long-term storage stability
- ✓ Inhibits microbial contamination

Why worry about storing red diesel in your tank?

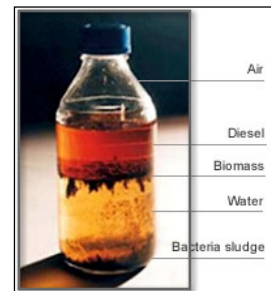

Red Diesel composition changed in 2011, Reduced sulphur (natural biocide) and increased Biodiesel (7%) has led to a **series of potential issues** for diesel boat owners to occur in standing / stored diesel in the UK.

When storing your boat away for periods of time, excess fuel in the tank can develop small deposits, sludge can accumulate in the bottom of the tank and varnishes may form on the walls. This is particularly a problem when fuel is stored for a prolonged time and/or is exposed to variations in temperatures.

The results of this are the boat having starting problems after storage and not running smoothly or potentially developing "Diesel Bug".

OneShot Diesel Storage Pro contains powerful antioxidants that inhibit the growth of fuel degradation products associated with ageing, by reducing the potential for sludge build up in fuel tanks, that result in varnishing, contamination or could be carried over into fuel pipes and engines resulting in blocked filters.

The product also contains a fuel biocide that prevents microbial growth, which can lead to operational problems and accelerated system corrosion.

OneShot Diesel Storage Pro should be added to the fuel tank prior to the last refuel before storage, ensuring maximum protection and performance over winter or long term storage.

A 1 Litre bottle of **OneShot Diesel Storage Pro** treats up to 4000 litres of fuel

Protection and Performance during Winter Storage
- No Worries !
